Continuation of 11. does NOT place the application in condition for allowance because: Applicants argue that the Storey et al. reference does not disclose meltblown fibers being present in an amount less than about 8 gsm on the side of a nonwoven web and that the secondary reference of Skoog et al. fails to describe linting properties of meltblown fibers, let alone linting properties in connection with the basis weight of meltblown fibers applied to the exterior of nonwoven webs. It is noted that the SKOOG et al. reference teahes that the meltblown layers prevent linting (mispelled as "Tinting" in the patent). (Col. 5, line 32) While the SKOOG reference further provides spunbond layer as the outer layers of the laminate, these are provided for abrasion resistanceand strength while the meltblown layers prevent linting by trapping the material of layer 160 (which is equivalent to the nonwoven material of the present invention. SKOOG et al. uses meltblown layers with a basis weight lower than the STOREY et al. reference, which demonstrates that the same results can be achieved by using a lower basis weight. Generally, differences in concentration or temperature will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such concentration or temperature is critical. "[W]here the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation." In re Aller, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955). Therefore, the rejections over the combination of STOREY et al. in view of SKOOG et al. are maintained herein.
